

For Our project we have decided to use HTML, CSS and React.Js because :

HTML

- HTML is the core building block essential for any web page required to create the essential elements of a site.
- Proper use of this language helps our site in securing a higher ranking.
- This is a universal language I.e. almost compatible with all web browsers , plug-ins etc.

CSS

- This language provides almost all kind of designs one could wish for in a site with necessary skills.
- Easy to understand and simple to implement
- Goes hand in hand with HTML
- Other benefits like animations etc. can also be implemented with necessary skills.

React.JS

- React allows a more component based design, where blocks can be built and implemented in our site easily.
- Easier to learn compared to other languages.
- Ideal for dynamic programs, where frequent interactions are necessary.
- Easy AI integration is available for our AI plug-ins.
- Efficient use of resources keep the page fast and smooth while surfing.
